This is a step-by-by guide for running this application on your own system.

Tools needed:

Java JDK, version used 25.0.1

JAVA IDE

MySQL Server, version used 8.4.11 LTS Community Edition

MySQL Connector/J, version used 26.7.0

MySQL Workbench – Optional – useful for running scripts and viewing tables

All MySQL downloads can be found here:

https://dev.mysql.com/downloads/

Setup

1. Install the tools and during MySQL install, set a password for the root account
2. Import or open the project in your IDE
    a. Add the Connector/J JAR to the project's classpath
3. Create the database and tables
    a. Run sql/schema.sql as the MySQL root user
    b. Verify script was successful with commands: USE rescue_animals; SHOW TABLES;
    c. You should see animals, dogs and monkeys
4. Create an account for the application

    a. Open the create_app_user.sql and change CHANGE_THIS_PASSWORD to a password of your choice
    b. Run as root, the same as in step 3
5. Create db.properties following db.properties.example and the steps below
    a. Create a file named db.properties in the root folder with the following contents and your password from step 3

       db.url=jdbc:mysql://localhost:3306/rescue_animals

       db.user=rescue_app

       db.password=YOUR_PASSWORD_HERE
6. Run the application
    a. Run driver.java as a Java application
    b. Alternatively, you can set USE_DATABASE to false to run the in-memory storage instead, but data will be lost upon exit
