The submission contains three project folders. The original artifact completely untouched. The modified original, which has minimal changes strictly to show differences in performance between the original and the enhanced. And finally, the enhanced artifact.

The project folder contains several CSV files which can be used for testing the application.

Fake_data.csv contains 100,000 rows of fake data. One column of passport numbers and another with names.

Fake_data_sorted.csv contains the same data as fake_data.csv but sorted alphanumerically. This will load with the enhanced artifact but will cause a stack overflow with the original.

CS 300 ABCU_Advising_Program_Input.csv contains the original artifact csv with course numbers, names and prerequisites.

Due to the limitations of generating large amounts of fake data, both fake_data csv's do not contain a third prerequisite column and mainly serve to verify balance and performance utilizing the available providers of passport number and name which function effectively the same as a course number and name.
